

COOLING FAN MOUNTING INSTRUCTIONS

In order to cool the motor efficiently we found we had to fit the cooling fan on its own bracketing. This also mean't that it avoided fouling the end of the motor shaft.

Fit 3 or 4 of the brackets to the motor in the fashion shown here. We found that 3 worked perfectly well and was easier to fit - but 4 have been supplied.

Next - wrap the jubilee clip around the motor circumference and attach until there is just a few millimeters slack all round.

Offer up the cooling fan - sliding all the bracket tangs into place - you may find that the fan needs to be in a diagonal presentation to sit comfortably with the seat.

Finally - simply tighten the jubilee clip until the tangs are held firm and check that the fan mounting screws are also tight

Now continue on to fit the remaining components of the 24v kit
